Hold the fraud, not the shop.

ACCOUNT FROZEN

One fraud payment lands in an honest merchant's account, and the whole account is frozen. Across India, the money held mostly never comes back.

₹7,647 Cr

HELD ON COMPLAINTS

₹167 Cr

RESTORED TO VICTIMS

2.18%

OF HELD MONEY RETURNED

Source: **MHA/I4C SOP for NCRP-CFCFRMS, Custody, Restoration and Grievance Redressal, 02.01.2026** — April 2021 to November 2025 · pitch/NUMBERS.md

A ₹1,200 grocery sale froze a ₹51,200 shop.

ACCOUNT ON THE TRAIL	WHOLE-ACCOUNT FREEZE
Kirana shop · goods delivered	**₹51,200**
Landlord · ₹5,000 rent received	**₹1,55,000**
Payment-aggregator pool · settles other merchants	**₹5,00,20,000**
Three mule accounts	₹1,23,800

99.75% of what the freeze locks belongs to people who did nothing wrong.

Who uses Wapsi

The bank's **cyber-fraud nodal officer**: traces split and layered money by hand, with an STR due within 7 working days.

Who it protects

The **merchant** who loses working capital and the **customer** who loses the account. The bank loses both, and answers the grievance.

Reinvent Commerce

Keep commerce running and keep the customer: hold the victim's money, not the business.

Source: showcase case 1, hand-computed synthetic fixture **src/wapsi/fixtures/showcase.py** · rows in pitch/NUMBERS.md · STR deadline: data/docs/facts.json (FIU-IND FAQ)

Trace. Hold the amount. Verify. A human signs.

1 Trace

Follow the complaint's money through every layer of mule accounts, split per victim pro-rata (SOP 5(xiii)).

`transactions · NCRP text · voice notes`

2 Amount-specific hold

Hold `min(victim money, balance)` per account. Never a whole-account freeze unless an approved, recorded exception.

`SOP 5(ix), 9.1`

3 Verified drafts

STR, hold instructions, customer notice, restoration packet. Gemma 4 writes the words; the verifier recomputes every number and citation.

`numbers from data, words from the model`

4 Maker-checker

A supervisor other than the analyst approves, bound to the draft's SHA-256 fingerprint, into a hash-chained audit log.

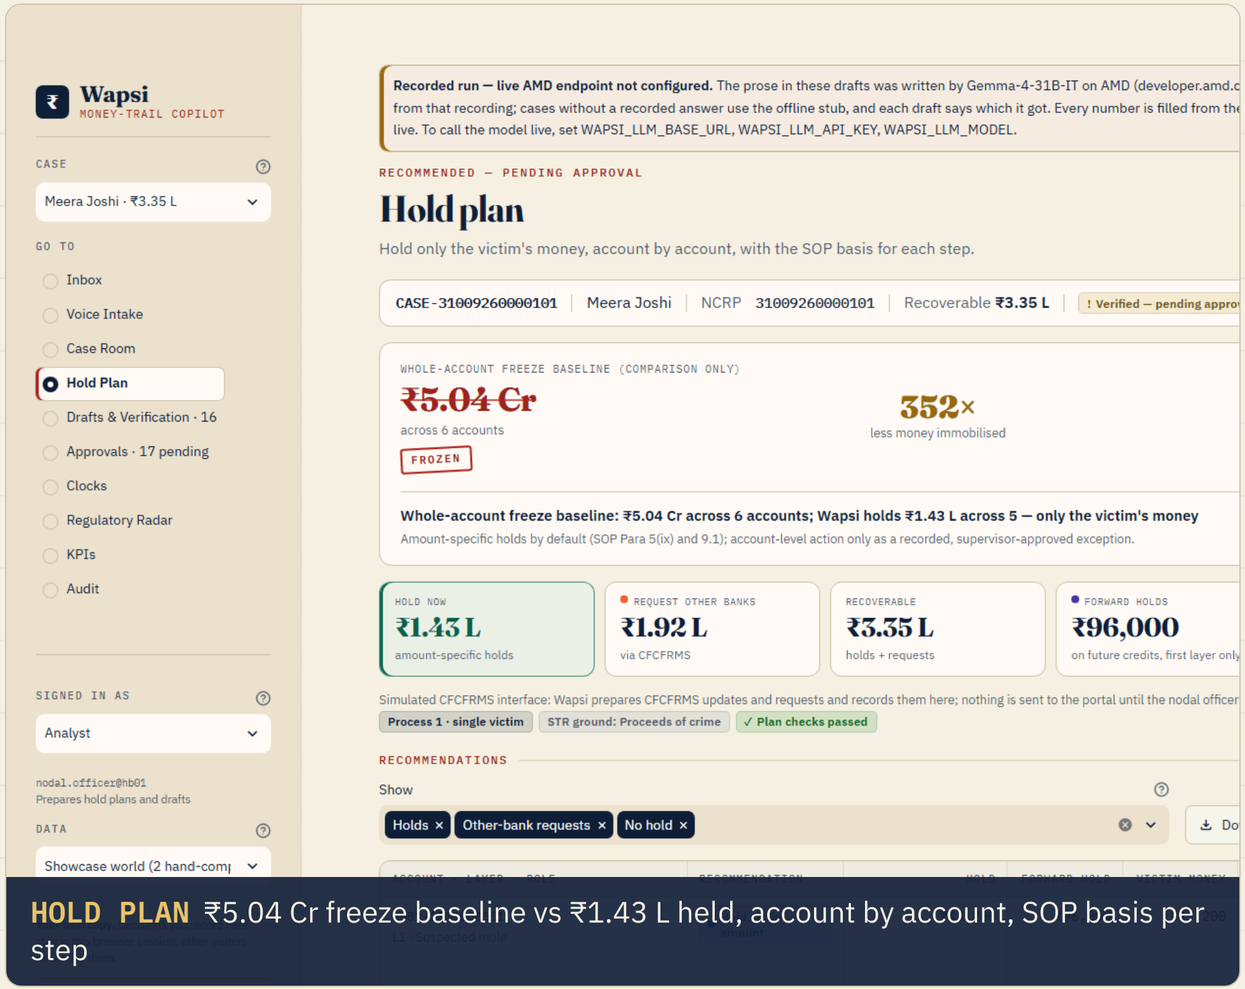

`nothing moves without a human`

Showcase case 1: freeze baseline **₹5,03,50,000** in 6 accounts

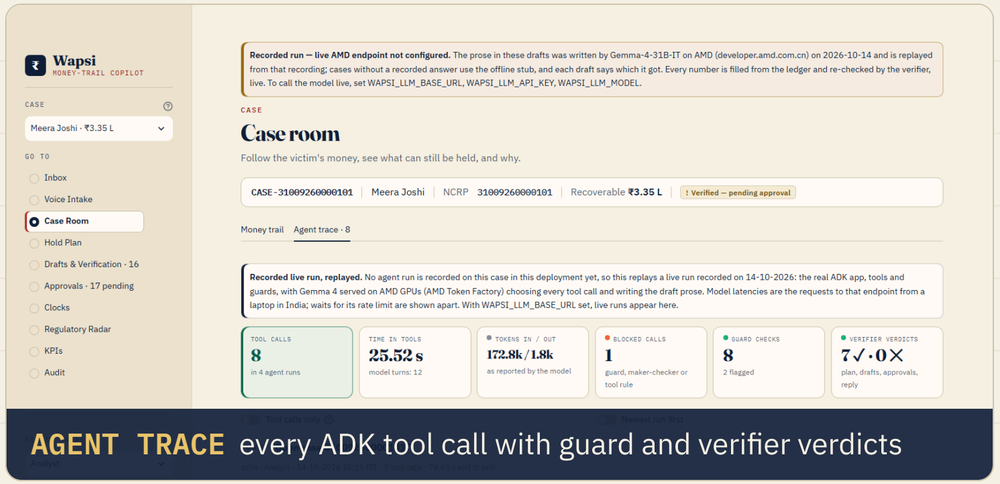

Wapsi holds **₹1,42,848** in 5 accounts

Source: **pitch/NUMBERS.md** (showcase case 1, src/wapsi/fixtures/showcase.py) · rules: AGENTS.md hard rules, SOP IDs in src/wapsi/citations.py · synthetic data

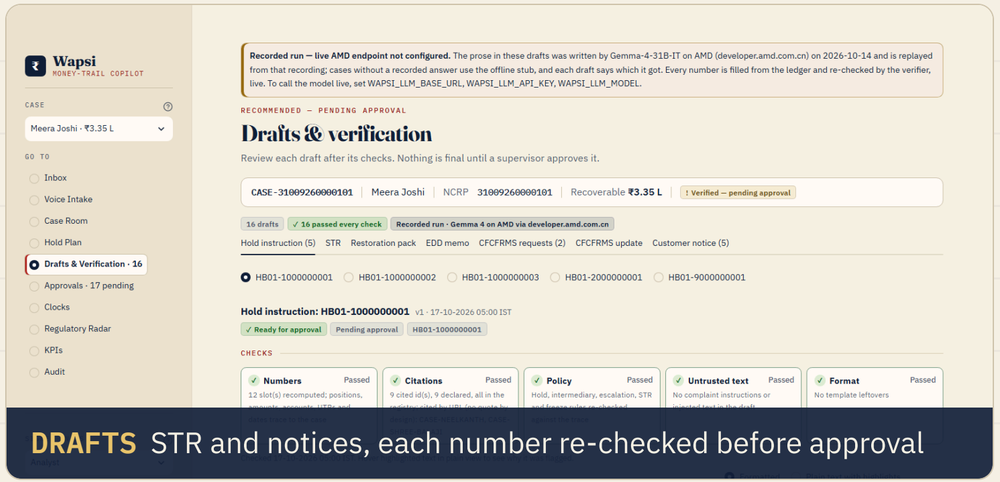

From complaint to an approvable hold plan.

HOLD PLAN ₹5.04 Cr freeze baseline vs ₹1.43 L held, account by account, SOP basis per step

AGENT TRACE every ADK tool call with guard and verifier verdicts

DRAFTS STR and notices, each number re-checked before approval

Screens: **Streamlit UI (ui/app.py), recorded mode**, synthetic showcase case 1; the prose is a labelled replay of Gemma 4 on AMD Token Factory (14 Oct 2026). More: screens/case_room.png, screens/voice_intake.png

Transparent predictions. Never the money.

Predicted: the account's role

Mule, innocent holder, merchant, pool account. A transparent logistic scorer (default) with per-feature reasons; a GraphSAGE GNN on ROCm behind the same interface.

Never predicted: the amount

A hold is arithmetic, `min(victim money, balance)`. Score ≥ 0.6 mule, ≤ 0.35 innocent, between: the officer decides.

Hard rules first

A merchant needs a delivered invoice for every disputed credit. Pool accounts never get a forward hold.

GNN trained on an AMD Instinct MI300X, 14 Oct 2026

HARD WORLD, 64 CASES	HEURISTIC	GNN · MI300X
Mule ROC-AUC	0.9411	0.9202
Dispositions right	0.9198	0.9198
Innocent-holder recall	0.6875	**0.875**
Holds exact · over-hold	1.0 · ₹0	1.0 · ₹0

Validation AUC 1.0 is on a saturated synthetic world, so we report the hard world built to fool the classifier. 410,017 parameters, 0.055 s per epoch, 0.39 GB peak. Every miss is a label, never money.

Source: **editions/amd/evidence/notebook/2026-10-14/** gnn_metrics.json, gnn_hard_eval.json (by_scorer: GNN and heuristic, same run) · AGENTS.md

One MI300X serves the whole copilot.

Measured 14 Oct 2026 on an AMD Instinct MI300X (AMD AI Notebook, ROCm 7.14, vLLM 0.23)

Device peak while serving: 97.0 GB of 191.7 GB. Whisper and the GNN were measured on the same GPU, each in turn.

773
output tok/s on real drafting prompts, concurrency 32 (TTFT p50 0.12 s)

1,590
complete cases per hour through the pipeline, concurrency 16

0.03
Whisper large-v3-turbo real-time factor, steady state: a 31 s voice note in 0.92 s

0.055 s
per GNN epoch, PyTorch on ROCm, 0.39 GB peak

Open weights, the bank's own rack: the same code moves from AMD's hosted API to one AMD GPU by changing three settings.

Measured 14 Oct 2026 on AMD Instinct MI300X · **editions/amd/evidence/notebook/2026-10-14/golden_eval.json** (session 4; llm_only_hallucination_rate 0.4872) · **ab_hallucination.json** (session 5) (STR A/B, 155 bound drafts)

Gemma 4 writes. Google ADK runs the agent.

Gemma 4 31B

- Primary model for draft prose, complaint and voice-note fields
- Never types a number: placeholders only
- Every draft names the model that wrote it

Google ADK agent

- 10 pipeline tools, native tool calls from Gemma 4
- JSON tool protocol as the safety net
- A reply with an amount no tool returned is replaced

Agent trace

- Every tool call with guard and verifier verdicts
- Redacted and sealed into the case's audit chain
- Replay is always labelled as a recording

Live run · AMD Token Factory (Gemma-4-31B-IT), 14 Oct 2026 · AMD-served, not an MI300X benchmark

5 tool calls behind "Open case"

16/16 drafts verified

24/24 values in the reply came from a tool

Free the honest money, for $1.25 per 1,000 cases.

Showcase case 1 · hand-computed

Freeze ₹5,03,50,000 · 6 accounts

Wapsi ₹1,42,848 · 5

The freeze locks 352× what Wapsi holds.

Demo world · 39 cases, 10 fraud typologies

Freeze ₹35.26 Cr · 101 accounts

Wapsi ₹29.19 L · 84

0.83% of the freeze; 0 false freezes.

$1.25 / 1,000 cases

Gemma 4 on one MI300X at the $1.99 per GPU-hour list price, concurrency 16.

1,590 cases / hour

One GPU; 12,274 drafts per GPU-hour, each verified before a human sees it.

1,586 buyers

Regulated entities on CFCFRMS. A licence per entity, on an endpoint the bank controls.

Sources: **pitch/NUMBERS.md** (showcase case 1 = src/wapsi/fixtures/showcase.py; demo world = evals/reports/demo.json, same baseline in golden_eval.json) · cost and throughput: **editions/amd/evidence/notebook/2026-10-14/bench/e2e_c16.json**, MI300X, 14 Oct 2026 · entities: data/docs/facts.json

What this is not, yet.

Limits we state

- All banking data is synthetic. No real customer, victim or bank data.
- CFCFRMS is a **simulated interface**; nothing is sent to the portal.
- The RBI money-mule SOP is a **DRAFT** (comments closed 2 Oct 2026), never treated as in force.
- GNN validation AUC 1.0 is on a saturated world; the heuristic stays the default.
- Our metric is money identified and held correctly, not money restored.

Next

- A pilot with one bank's fraud desk on data it controls.
- Payment aggregators whose pool accounts get frozen.
- Voice intake with Whisper in the loop, measured end to end.
- A verifier-filtered LoRA of Gemma 4 on the MI300X.
- Price set after bank validation calls.

Source: **AGENTS.md** (synthetic data, simulated CFCFRMS, DRAFT RBI SOP) · pitch/amd/DECK_OUTLINE.md · docs/originality.md (pre-event core tagged amd-baseline)

Hold the fraud.
Keep the shop open.

We ask for a pilot with one bank's cyber-fraud desk on an AMD endpoint it controls, and introductions to payment aggregators whose pool accounts get frozen.
